TLP:CLEAR

Product ID: AA23-213A

August 1, 2023

Threat Actors Exploiting Ivanti EPMM Vulnerabilities

SUMMARY

The Cybersecurity and Infrastructure Security Agency (CISA) and the Norwegian National Cyber Security Centre (NCSC-NO) are releasing this joint Cybersecurity Advisory (CSA) in response to active exploitation of CVE-2023-35078 and CVE-2023-35081. Advanced persistent threat (APT) actors exploited CVE-2023-35078 as a zero day from at least April 2023 through July 2023 to gather information from several Norwegian organizations, as well as to gain access to and compromise a Norwegian government agency's network.

Ivanti released a patch for CVE-2023-35078 on July 23, 2023. Ivanti later determined actors could use CVE-2023-35078 in conjunction with another vulnerability CVE-2023-35081 and released a patch for the second vulnerability on July 28, 2023. NCSC-NO observed possible vulnerability chaining of CVE-2023-35081 and CVE-2023-35078.

CVE-2023-35078 is a critical vulnerability affecting Ivanti Endpoint Manager Mobile (EPMM) (formerly known as MobileIron Core). The vulnerability allows threat actors to access personally identifiable information (PII) and gain the ability to make configuration changes on compromised systems. CVE-2023-35081 enables actors with EPMM administrator privileges to write arbitrary files with the operating system privileges of the EPMM web application server. Threat actors can chain these vulnerabilities to gain initial, privileged access to EPMM systems and execute uploaded files, such as webshells.

Mobile device management (MDM) systems are attractive targets for threat actors because they provide elevated access to thousands of mobile devices, and APT actors have exploited a previous MobileIron vulnerability. Consequently, CISA and NCSC-NO are concerned about the potential for widespread exploitation in government and private sector networks.

This CSA provides indicators of compromise (IOCs) and tactics, techniques, and procedures (TTPs) obtained by NCSC-NO investigations. The CSA also includes a nuclei template to identify unpatched

U.S. organizations: To report suspicious or criminal activity related to information found in this joint Cybersecurity Advisory, contact CISA's 24/7 Operations Center at Report@cisa.gov or (888) 282-0870. When available, please include the following information regarding the incident: date, time, and location of the incident; type of activity; number of people affected; type of equipment used for the activity; the name of the submitting company or organization; and a designated point of contact. **Norwegian organizations:** NCSC-NO is available 24/7 at cert@ncsc.no and +47 23 31 07 50 for incidents in Norway.

This document is marked TLP:CLEAR. Disclosure is not limited. Sources may use TLP:CLEAR when information carries minimal or no foreseeable risk of misuse, in accordance with applicable rules and procedures for public release. Subject to standard copyright rules, TLP:CLEAR information may be distributed without restriction. For more information on the Traffic Light Protocol, see cisa.gov/tlp.

TLP:CLEAR

devices and detection guidance organizations can use to hunt for compromise. CISA and NCSC-NO encourage organizations to hunt for malicious activity using the detection guidance in this CSA. If potential compromise is detected, organizations should apply the incident response recommendations included in this CSA. If no compromise is detected, organizations should still immediately apply patches released by Ivanti.

For a downloadable copy of IOCs in .xml and .json format, see:

- [AA23-213A STIX XML](#)
- [AA23-213A STIX JSON](#)

TECHNICAL DETAILS

Note: This advisory uses the [MITRE ATT&CK® for Enterprise](#) framework, version 13. See the MITRE ATT&CK Tactics and Techniques section of this advisory for a table of the threat actors' activity mapped to MITRE ATT&CK® tactics and techniques. For assistance with mapping malicious cyber activity to the MITRE ATT&CK framework, see CISA and MITRE ATT&CK's [Best Practices for MITRE ATT&CK Mapping](#) and CISA's [Decider Tool](#).

Overview

In July 2023, NCSC-NO became aware of APT actors exploiting a zero-day vulnerability in Ivanti Endpoint Manager (EPMM), formerly known as MobileIron Core, to target a Norwegian government network. Ivanti confirmed that the threat actors exploited CVE-2023-35078 and released a patch on July 23, 2023.^[1] Ivanti later determined actors could use CVE-2023-35078 in conjunction with another vulnerability, CVE-2023-35081, and released a patch for the second vulnerability on July 28, 2023.^[2]

CVE-2023-35078 is a critical authentication bypass [\[CWE-288\]](#) vulnerability affecting Ivanti Endpoint Manager Mobile (EPMM), formerly known as MobileIron Core. The vulnerability allows unauthenticated access to specific application programming interface (API) paths. Threat actors with access to these API paths can access PII such as names, phone numbers, and other mobile device details of users on the vulnerable system; make configuration changes to vulnerable systems; push new packages to mobile endpoints; and access Global Positioning System (GPS) data if enabled.

According to Ivanti, CVE-2023-35078 can be chained with a second vulnerability [CVE-2023-35081](#).^[2] CVE-2023-35081 is directory traversal vulnerability [\[CWE-22\]](#) in EPMM. This vulnerability allows threat actors with EPMM administrator privileges the capability to write arbitrary files, such as webshells, with operating system privileges of the EPMM web application server. The actors can then execute the uploaded file.^[2]

CISA added CVE-2023-35078 to its [Known Exploited Vulnerabilities Catalog](#) on July 25, 2023, and CVE-2023-35081 on July 31, 2023.

CISA and NCSC-NO are concerned about the potential for widespread exploitation of both vulnerabilities in government and private sector networks because MDM systems provide elevated access to thousands of mobile devices. Threat actors, including APT actors, have previously exploited a MobileIron vulnerability^{[3],[4]}.

APT Actor Activity

The APT actors have exploited CVE-2023-35078 since at least April 2023. The actors leveraged compromised small office/home office (SOHO) routers, including ASUS routers, to proxy [T1090] to target infrastructure, and NCSC-NO observed the actors exploiting CVE-2023-35078 to obtain initial access to EPMM devices [T1190] and:

- Perform arbitrary Lightweight Directory Access Protocol (LDAP) queries against the Active Directory (AD).
- Retrieve LDAP endpoints [T1018].
- Use API path `/mifs/aad/api/v2/authorized/users` to list users and administrators [T1087.002] on the EPMM device.
- Make EPMM configuration changes (**Note:** It is unknown what configuration changes the actors made).
- Regularly check EPMM Core audit logs [T1005].

The APT actors deleted some of their entries in Apache httpd logs [T1070] using `mi.war`, a malicious Tomcat application that deletes log entries based on the string in `keywords.txt`. The actors deleted log entries with the string `Firefox/107.0`.

The APT actors used Linux and Windows user agents with `Firefox/107.0` to communicate with EPMM. Other agents were used; however, these user agents did not appear in the device logs. It is unconfirmed how the threat actors ran shell commands on the EPMM device; however, NCSC-NO suspects the actors exploited CVE-2023-35081 to upload webshells on the EPMM device and run commands [T1059].

The APT actors tunneled traffic [T1572] from the internet through Ivanti Sentry, an application gateway appliance that supports EPMM, to at least one Exchange server that was not accessible from the internet [T1090.001]. It is unknown how they tunneled traffic. NCSC-NO observed that the network traffic used the TLS certificate of the internal Exchange server. The APT actors likely installed webshells [T1505.003] on the Exchange server in the following paths [T1036.005]:

- `/owa/auth/logon.aspx`
- `/owa/auth/logoff.aspx`
- `/owa/auth/OutlookCN.aspx`

NCSC-NO also observed `mi.war` on Ivanti Sentry but do not know how the actors placed it there.

MITRE ATT&CK TACTICS AND TECHNIQUES

See Table 1–Table 7 for all referenced threat actor tactics and techniques in this advisory.

Table 1: APT Actors ATT&CK Techniques for Initial Access

Technique Title	ID	Use
Exploit Public-Facing Application	T1190	The APT actors exploited CVE-2023-35078 in public facing Ivanti EPMM appliances since at least April 2023.

Table 2: APT Actors ATT&CK Techniques for Execution

Technique Title	ID	Use
Command and Scripting Interpreter	T1059	The APT actors may have exploited CVE-2023-35081 to upload webshells on the EPMM device and run commands.

Table 3: APT Actors ATT&CK Techniques for Discovery

Technique Title	ID	Use
Account Discovery: Domain Account	T1087.002	The APT actors exploited CVE-2023-35078 to gather EPMM device users and administrators.
Remote System Discovery	T1018	The APT actors retrieved LDAP endpoints.

Table 4: APT Actors ATT&CK Techniques for Persistence

Technique Title	ID	Use
Masquerading: Match Legitimate Name or Location	T1036.005	The APT actors likely installed webshells at legitimate Exchange server paths.
Server Software Component: Web Shell	T1505.003	The APT actors implanted webshells on the compromised infrastructure.

Table 5: APT Actor ATT&CK Techniques for Defense Evasion

Technique Title	ID	Use
Indicator Removal	T1070	APT actors deleted httpd access logs after the malicious activities took place using string <code>Firefox/107.0</code> .

Table 6: APT Actor ATT&CK Techniques for Collection

Technique Title	ID	Use
Data from Local System	T1005	APT actors regularly checked EPMM Core audit logs.

Table 7: APT Actor ATT&CK Techniques for Command and Control

Technique Title	ID	Use
Protocol Tunneling	T1572	The APT actors tunneled traffic from the internet to an Exchange server that was not accessible from the internet.
Proxy	T1090	The actors leveraged compromised SOHO routers to proxy to and compromise infrastructure. The actors tunneled traffic from the internet to at least one Exchange server.
Proxy: Internal Proxy	T1090.001	The APT actors tunneled traffic from the internet to an Exchange server that was not accessible from the internet.

EVIDENCE OF VULNERABILITY METHODS

CISA recommends administrators use the following CISA-developed nuclei template to determine vulnerability to CVE-2023-30578:

```
id: CVE-2023-35078-Exposure

info:
```

name: Ivanti EPMM Remote Unauthenticated API Access

author: JC

severity: critical

reference:

- <https://nvd.nist.gov/vuln/detail/CVE-2023-35078>

description: Identifies vulnerable instances of Ivanti Endpoint Manager Mobile (EPMM), formerly MobileIron Core, through 11.10 allows remote attackers to obtain PII, add an administrative account, and change the configuration because of an authentication bypass.

tags: ivanti, mobileiron, epmm, auth-bypass

requests:

- method: GET

path:

- "{{RootURL}}/mifs/aad/api/v2/ping"

matchers-condition: and

matchers:

- type: status

status:

- 200

- type: word

part: body

words:

- "vspVersion"
- "apiVersion"

condition: and

CISA recommends administrators use the following CISA-developed nuclei template to determine vulnerability to CVE-2023-35081:

```
id: CVE-2023-35081

info:
  name: Ivanti EPMM Remote Arbitrary File Write
  author: JC
  severity: High
  reference:
    - https://nvd.nist.gov/vuln/detail/CVE-2023-35081
  description: Identifies vulnerable unpatched versions of Ivanti Endpoint
  Manager Mobile (EPMM), formerly MobileIron Core, through 11.10.0.3, 11.9.1.2,
  and 11.8.1.2 that allows an authenticated administrator to perform arbitrary
  file writes to the EPMM server.
  tags: ivanti, mobileiron, epmm

requests:
  - method: GET
    path:
      - "{{RootURL}}/mifs/c/windows/api/v2/device/registration"

  matchers-condition: and
  matchers:
    - type: status
      status:
        - 200

    - type: regex
      part: all
      regex:
```

```
- '.*\?VSP ((0?[0-9]|10)(\.\d+){1,3}|11\.(0?[0-7])(\.\d+){1,2}|11\.8\.\0(\.\d+)?|11\.8\.1\.[0-1]|11\.9\.\0(\.\d+)?|11\.9\.1\.[0-1]|11\.10\.\0\.[0-2])).*'
```

Run the following NCSC-NO-created checks to check for signs of compromise:

1. Investigate logs in centralized logging solutions or forwarded `syslogs` from EPMM devices for any occurrences of `/mifs/aad/api/v2/`.
2. Look for spikes or an increase of `EventCode=1644` in the AD since at least April 2023. The LDAP queries performed by EPMM when the threat actor used the MIFS API generated tens of millions of this event code. Also look for EventCodes `4662`, `5136`, and `1153`.
3. To detect tunneling activity through Sentry, look for traffic from EPMM devices to other internal servers, as well as TLS traffic towards instances of EPMM with different TLS certificates than the instance itself would possess. Traffic to EPMM with certificates originating from endpoints further inside the network, e.g. standard Windows generated certificates such as `CN=EXCHANGE01` or similar.
4. Perform forensic analysis of disk and memory since log retention may be poor and threat actors have been observed deleting log entries. Pay particular attention to unallocated disk space (free space on filesystem).
5. Check for activity from ASUS routers in your own country towards EPMM and Sentry devices.

INCIDENT RESPONSE

If compromise is detected, organizations should:

1. Quarantine or take offline potentially affected hosts.
2. Reimage compromised hosts.
3. Provision new account credentials.
4. Collect and review artifacts such as running processes/services, unusual authentications, and recent network connections.
5. Report the compromise to CISA via CISA's 24/7 Operations Center (report@cisa.gov or 888-282-0870) or to NCSC-NO via NCSC-NO's 24/7 Operations Center (cert@ncsc.no or +47 23 31 07 50).

MITIGATIONS

CISA and NCSC-NO recommend organizations:

- **Upgrade Ivanti EPMM versions to the latest version** as soon as possible. See [Ivanti CVE-2023-35081 - Remote Arbitrary File Write](#) for patch information. This patch protects against CVE-2023-35078 and CVE-2023-35081.
 - See the Evidence of Vulnerability Methods section of this advisory for CISA-developed nuclei templates to find any EPMM versions vulnerable to CVE-2023-35078 and CVE-2023-35081.

- Organizations using unsupported versions (i.e., versions prior to 11.8.1.0) should immediately upgrade to a supported version. If you cannot immediately upgrade, apply the Ivanti-provided RPM fix for CVE-35078 (this workaround does not protect against CVE-2023-35081):

1. Login to command line shell (CLI) in enable mode.
2. Run the following command: `# install rpm url https://support.mobileiron.com/ivanti-updates/ivanti-security-update-1.0.0-1.noarch.rpm`

See Ivanti's [Knowledge Base \(KB\) Remote unauthenticated API access vulnerability - CVE-2023-35078](#) for more information on the RPM fix.

- **Treat MDM systems as high-value assets (HVAs) with additional restrictions and monitoring.** MDM systems provide elevated access to thousands of hosts and should be treated as high value assets (HVAs) with additional restrictions and monitoring.
- **Follow best cybersecurity practices** in production and enterprise environments, including mandating [phishing-resistant multifactor authentication \(MFA\)](#) for all staff and services. For additional best practices, see CISA's [Cross-Sector Cybersecurity Performance Goals](#) (CPGs). The CPGs, developed by CISA and the National Institute of Standards and Technology (NIST), are a prioritized subset of IT and OT security practices that can meaningfully reduce the likelihood and impact of known cyber risks and common TTPs. Because the CPGs are a subset of best practices, CISA and NCSC-NO also recommend software manufacturers implement a comprehensive information security program based on a recognized framework, such as the NIST Cybersecurity Framework (CSF).

VALIDATE SECURITY CONTROLS

In addition to applying mitigations, CISA and NCSC-NO recommends exercising, testing, and validating your organization's security program against the threat behaviors mapped to the [MITRE ATT&CK for Enterprise](#) framework in this advisory. CISA recommends testing your existing security controls inventory to assess how they perform against the ATT&CK techniques described in this advisory.

To get started:

1. Select an ATT&CK technique described in this advisory (see Table 1–Table 7).
2. Align your security technologies against the technique.
3. Test your technologies against the technique.
4. Analyze your detection and prevention technologies' performance.
5. Repeat the process for all security technologies to obtain a set of comprehensive performance data.
6. Tune your security program, including people, processes, and technologies, based on the data generated by this process.

CISA recommends continually testing your security program, at scale, in a production environment to ensure optimal performance against the MITRE ATT&CK techniques identified in this advisory.
